

The map illustrates the predicted median daily incidence rate per 100,000 population for the 2019 novel coronavirus (2019-nCoV) during the 2019/2020 winter season across the United Kingdom. The map is divided into regions, and the predicted incidence rate is shown as a color gradient from light yellow (low) to dark red (high). A legend in the bottom right corner indicates the Mixing Ratio (g/kg) scale.

Key features of the map include:

- Regions:** The map is divided into regions, with the predicted incidence rate shown as a color gradient from light yellow (low) to dark red (high).
- Legend:** A color scale in the bottom right corner indicates the Mixing Ratio (g/kg) scale, ranging from 0 (light yellow) to 25 (dark red).
- Incidence Rate:** The predicted median daily incidence rate per 100,000 population is shown as a color gradient from light yellow (low) to dark red (high).
- Geographical Features:** The map includes the coastline of the United Kingdom and the surrounding waters.
