

This map illustrates the predicted distribution of the invasive plant species *Mimulus aurantiacus* across the United Kingdom in 2025. The map is divided into counties, each labeled with a predicted value (1-9). Blue contour lines represent the predicted distribution of the species. A color scale on the right indicates the Mixing Ratio (g/kg) from 0 to 25.

The map shows a high concentration of predicted values (1-3) in the central and northern regions, with values increasing towards the south and east. The color scale indicates that the Mixing Ratio (g/kg) ranges from 0 (lightest gray) to 25 (darkest green).

Key features include:

- County boundaries and predicted values (1-9).
- Blue contour lines representing the predicted distribution of the species.
- A color scale for the Mixing Ratio (g/kg) from 0 to 25.
